

Lavender Plants

Pre-plant care of your lavender plants

Best practice is to soak root ball and replant these young cuttings into small pots. (Do not remove root ball)

Minimal watering, no more than a spritz once a week directly onto soil.

Maintain a temperature of 60-75 degrees around plants.

Outplant into any well drained soil once soil temperatures reach 55 degrees and threat of frost is gone.

Post-plant care of your lavender plants

Full sun and minimal watering will yield the best growth.

Enjoy cutting throughout the summer months.

Prune into small ball in late fall.
